

**3.1 EXPONENTIAL FUNCTIONS**

What is an exponential function?

An exponential function  $f(x)$  is given by \_\_\_\_\_, where  $a$  is any number greater than 0 except 1.

If  $0 < a < 1$ , then we say that  $f(x)$  represents exponential \_\_\_\_\_.

If  $a > 1$ , then we say that  $f(x)$  represents exponential \_\_\_\_\_.

*Example:* Complete the table below, then graph

$$g(x) = 3^x.$$

$x$	$y$
-2	
-1	
0	
1	
2	

*Example:* Complete the table below, then graph

$$g(x) = \left(\frac{1}{3}\right)^x.$$

$x$	$y$
-2	
-1	
0	
1	
2	

*The number  $e$*

The number  $e$ , like  $\pi$ , is an irrational number that shows up enough in a variety of contexts to have its own symbol.

The number  $e$  is defined by  $\lim_{x \rightarrow \infty} \left(1 + \frac{1}{x}\right)^x \approx 2.718281828459$ .

Since  $e > 1$ , the graph of  $y = e^x$  is similar to the first example above.

*Taking the Derivative of  $e^x$ .*

If  $f(x) = e^x$ , then  $f'(x) =$  \_\_\_\_\_.

Using the chain rule, if  $u$  is a differentiable function of  $x$ , then  $\frac{d}{dx}[e^u] =$  \_\_\_\_\_.

*Example:* Find the derivative of each function.

a)  $h(x) = \frac{1}{3}e^{-4x}$

b)  $f(x) = x^7 e^{4x}$

c)  $g(x) = \sqrt{e^x + 1}$

d)  $f(x) = \frac{e^x}{1 - e^x}$
